Climate Restoration - An idea whose time has come

The climate restoration movement calls for transition to clean net zero energy PLUS restoring the climate to pre-industrial levels of CO₂ & methane. A level that was safe for humanity for thousands of years. A Climate Restoration 2050 campaign will do this by engaging a global community of groups and individuals committed to achieving measurable climate restoration goals by 2030, 2040 and 2050.

We can restore a pre-industrial climate to our planet by 2050. Climate Restoration requires removing a trillion tons of excess CO₂ from the atmosphere. This task is enormous, technically challenging, and feasible. Scientists and engineers have developed several major technological areas for greenhouse gas removal and sustainable (thousands of years) storage:

- Local Ocean Fertilization, Algae blooms for deep sea carbon sinking
- Synthetic Limestone manufacture for carbon sequestration
- Seaweed permaculture, mangrove & tree forestation, bamboo & hemp planting
- CO₂ Direct Air Capture and Atmospheric Methane Removal

These technologies are safe and practical—and they require little if any government funding since they can be financed largely through existing markets. They have enormous promise as vehicles for achieving climate restoration.

Climate Restoration Alliance climaterestorationalliance.org

The Climate Restoration Alliance (CRA) is a global movement dedicated to restoring a safe and healthy climate for future generations. It has a Climate Restoration 2050 campaign to restore a pre-industrial climate by 2050.

Foundation for Climate Restoration foundationforclimaterestoration.org

The Foundation for Climate Restoration (F4CR) is dedicated to restoring a historically safe climate by 2050. “Historically safe” means a climate in which human beings have thrived for millennia. It’s the pre-industrial climate.
